The Brain 6.3.42

Quick Start & Decision Guide

For Torn desktop, Tampermonkey, and TornPDA

The Brain is an optimizer, not an autopilot. Review every recommendation before acting.

The Brain analyzes your current Torn stock portfolio, compares it with the portfolio it would build under current market conditions, and recommends the next measurable financial action.

Its job is to answer: “What is the strongest measurable financial move from here?” It does not decide what every Torn player should personally value.

1. First-time setup

1. Open Torn’s Stock Market page.
2. Open ⚙ Settings in The Brain.
3. Enter a Limited or Custom API key using only the permissions The Brain requires.
4. Enter Deployable Capital — cash you are genuinely willing to invest in stocks.
5. Review Strategic Target and Strategic Sale Candidates before your first serious analysis.
6. If you use TCI, review the Current Bank Investment setting and Bank Intelligence section.
7. Save settings, then click Analyze Portfolio.

Deployable Capital means liquid cash you are willing to invest. Do not include money reserved for other purposes.

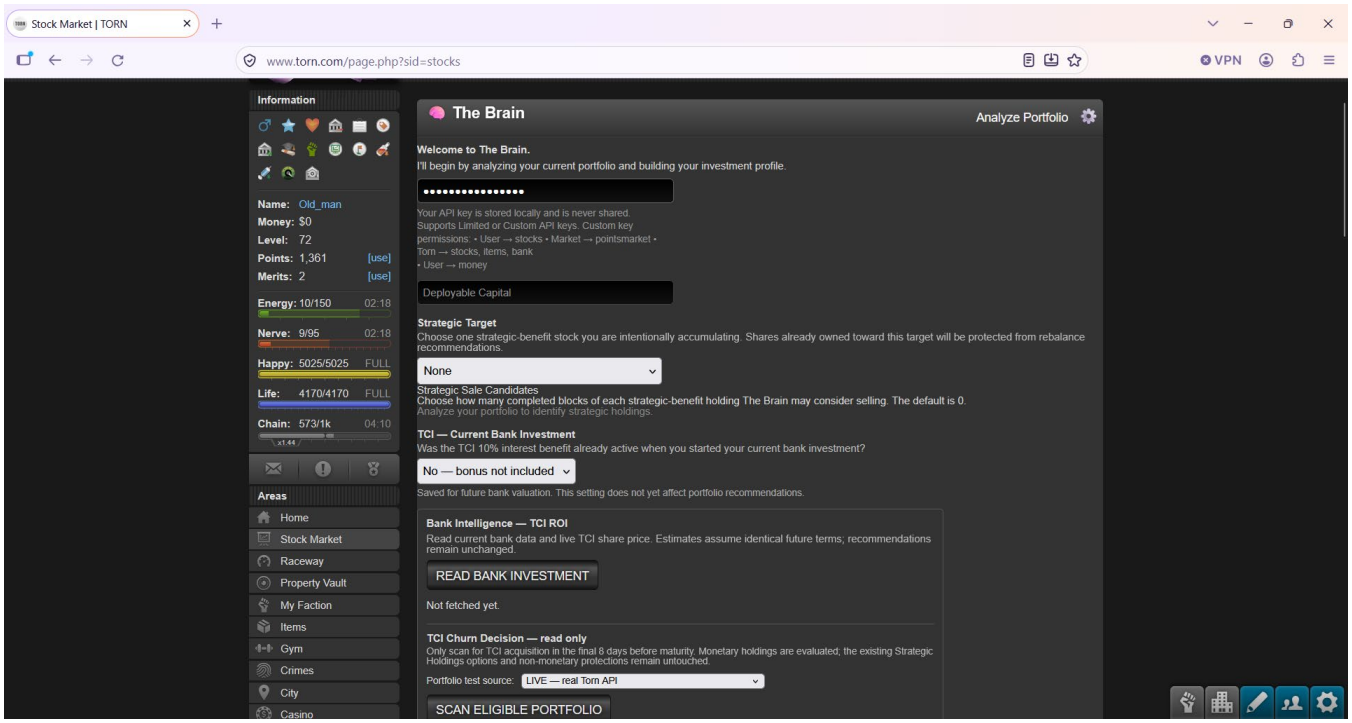

Figure 1. The Brain settings — enter deployable capital, review strategic protections, and configure TCI bank intelligence before analyzing.

2. Understanding the recommendation

BUY — The Brain found an improvement you can afford now. Buy the listed shares.

REBALANCE — The Brain found a better portfolio using your current holdings and available capital. Sell the listed shares, then buy the listed shares. The buy list is displayed in The Brain's preferred purchase order.

SAVE FOR — No better immediate move is available. The Brain shows the highest-value next target, the cash still needed, and the target's expected ROI.

HOLD — The Brain found no worthwhile measurable improvement with the current portfolio and available capital.

3. Always open "Why?"

The recommendation headline tells you what to do. The Why? section tells you why. Before acting, expand it and review the numbers.

- Net proceeds from sales
- Purchase cost
- Capital remaining
- Current portfolio income
- Projected portfolio income
- Annual improvement
- Target cost
- Expected ROI
- Cash still needed to complete a target

Daily portfolio income is an annualized average. Torn does not deposit that exact amount every day; stock rewards arrive on their normal schedules and may include cash, items, or points.

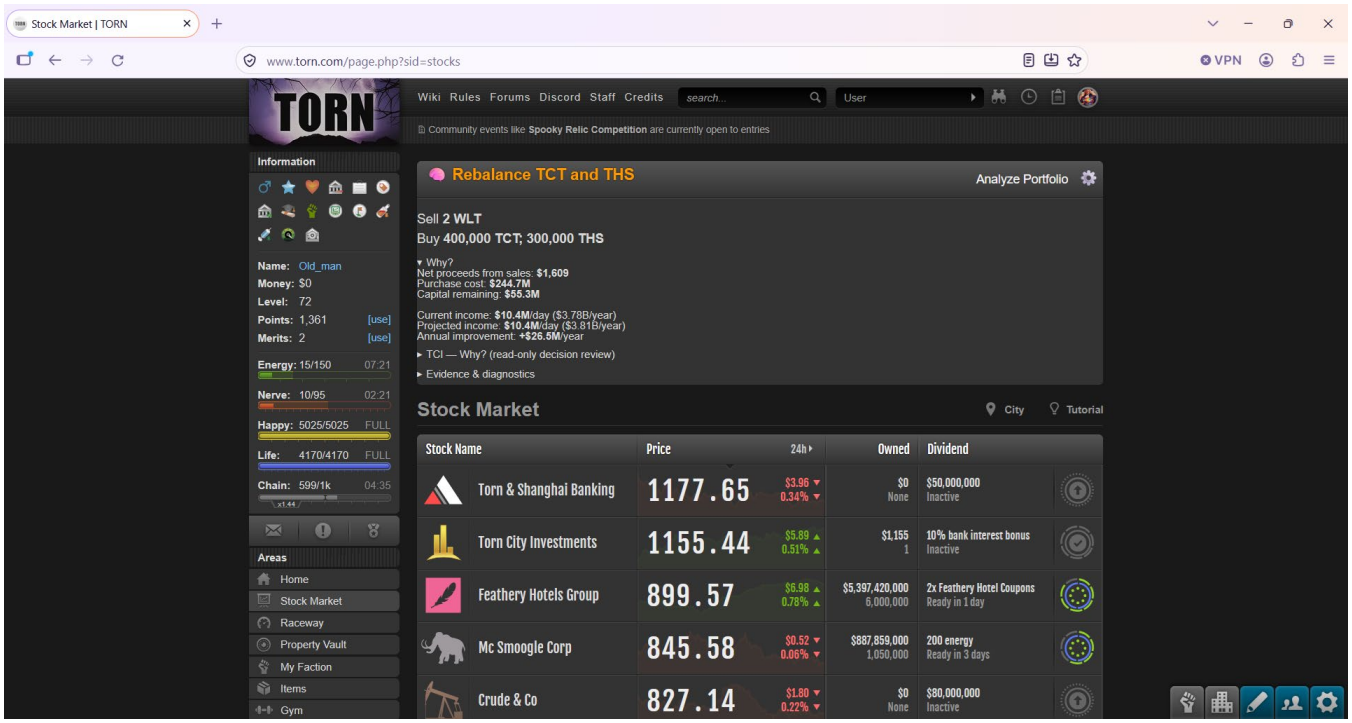

Figure 2. REBALANCE — The Brain identifies what to sell and buy, then shows the measurable before-and-after result under Why?.

4. SAVE FOR

SAVE FOR does not mean “do nothing forever.” It means The Brain did not find a better immediate purchase or rebalance, and the next highest-value target is still out of reach.

The panel shows how much cash is still required, the target cost, expected ROI, and what your current portfolio is already producing while you save.

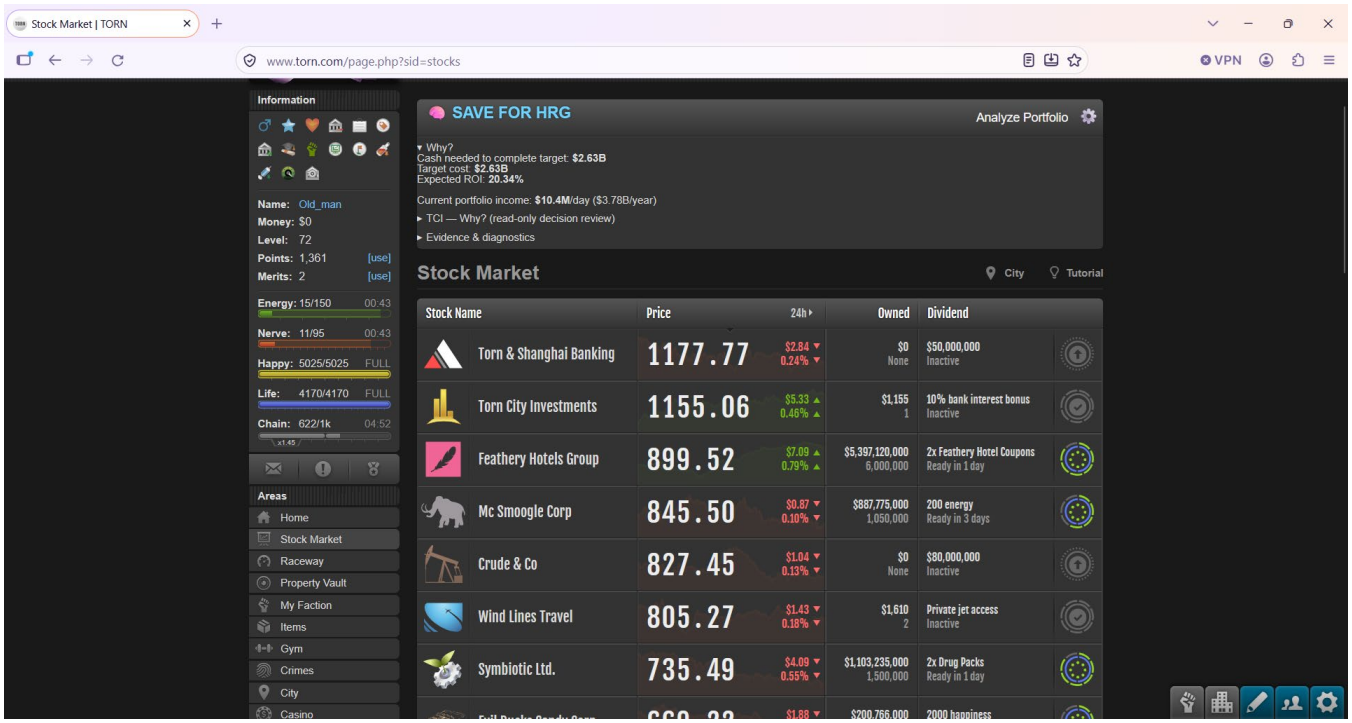

Figure 3. SAVE FOR — The Brain shows the next target, the cash still needed, expected ROI, and what the current portfolio is already producing.

5. Strategic stocks and human judgment

The Brain optimizes measurable financial value. Some stock benefits have real value to a player but cannot honestly be reduced to one universal dollar figure. Those benefits are handled strategically.

If you personally value a strategic benefit, protect it. The Brain may correctly determine that the same capital could earn more elsewhere; that does not automatically mean you should give up the benefit.

WLT — Wind Lines Travel

WLT provides Private Jet Access. That is a gameplay benefit rather than a normal cash-producing dividend.

- If Private Jet Access is a deliberate goal, select WLT as your Strategic Target.
- Shares already accumulated toward that target should be treated as intentional progress rather than disposable capital.
- The Brain may still show the opportunity cost of choosing WLT over higher-return investments.
- Accepting that opportunity cost is a player decision, not an optimizer error.

6. TCI — Torn City Investments

TCI is different from most strategic benefits because its 10% bank-interest bonus has measurable financial value. The Brain's Bank Intelligence and TCI review are designed to evaluate that value using bank and market evidence.

> **Important:** a TCI SELL recommendation does not mean "TCI is bad." It can mean the bank benefit for the current cycle has already been captured and that the capital may earn more elsewhere until the next useful TCI window.

- Set whether the TCI 10% bonus was already active when the current bank investment began.
- Use Read Bank Investment to inspect the current bank position and TCI economics.
- TCI acquisition timing matters. The Brain evaluates the relevant window around bank maturity rather than treating TCI as a permanent hold.
- Read the TCI — Why? decision review before acting.
- After a new bank deposit or major stock transaction, run The Brain again.

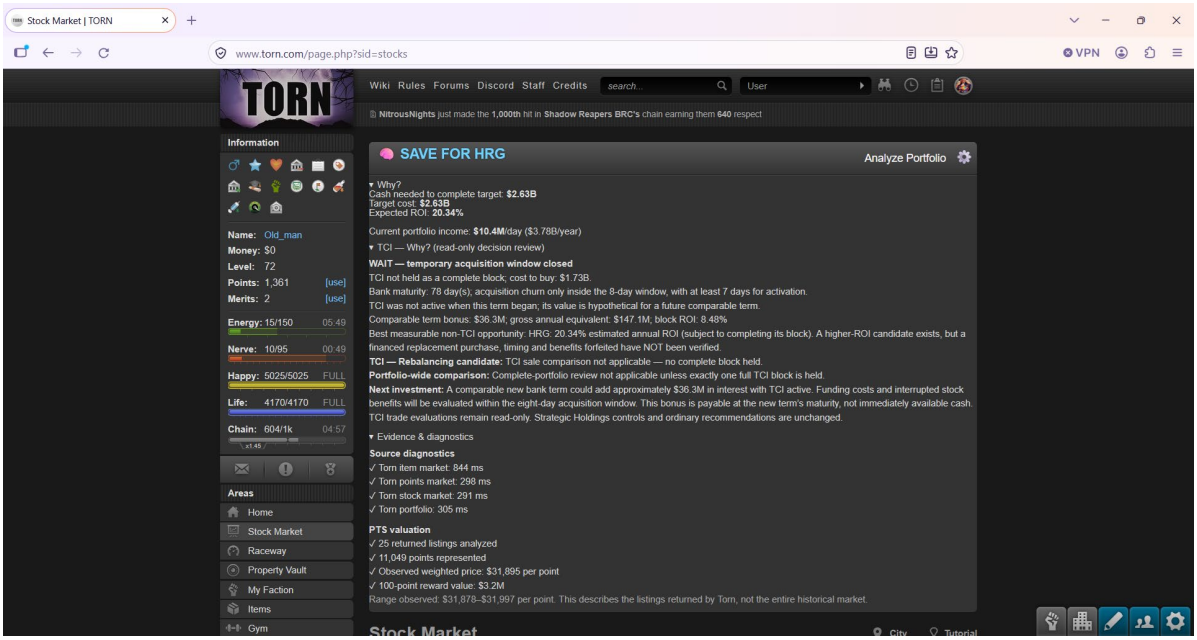

Figure 4. Advanced TCI example — the expanded TCI decision review explains the temporary acquisition window, comparable-term value, and why a TCI action may or may not be appropriate.

7. Strategic Sale Candidates

Strategic Sale Candidates controls how many completed strategic-benefit blocks The Brain may consider selling.

0 means protected. Only expose strategic blocks for sale if you are genuinely willing to give up that benefit.

Do not increase these settings merely to force a larger rebalance recommendation. The setting represents permission, not a suggestion.

8. Recommended workflow

8. Enter real deployable cash.
9. Review Strategic Target and strategic protections.
10. Review TCI bank settings if applicable.

11. Click Analyze Portfolio.
12. Read the recommendation.
13. Open Why? and review the measurable consequences.
14. Decide whether the financial recommendation matches your personal goals.
15. Make the transaction.
16. Run The Brain again after any material purchase, sale, or new bank investment.

Final rule

Use the math. Keep the judgment.
The Brain is designed to make the measurable trade-offs visible. It can tell you what produces the strongest financial result under its evidence and rules. It cannot decide how much Private Jet Access, racing, education, company benefits, convenience, or other personal goals are worth to you.
